TOMCAT is tougher than a barnyard cat for controlling rats and mice. TOMCAT baits are manufactured with human food-grade ingredients and enhancers, for a bait so palatable that rats and mice can’t resist. Containing the anticoagulant diphacinone, TOMCAT is an economical, multiple-feeding bait that kills rats and mice in 4 to 6 days.

TOMCAT WITH BROMETHALIN mouse and rat killer contains the active ingredient bromethalin 0.01%, the most efficient active ingredient allowed by the EPA Mitigation Decision.

POST-MITIGATION HOMEOWNER PRODUCTS
TOMCAT Mouse & Rat Killer contains the active ingredient bromethalin, the most efficient active ingredient allowed by the EPA Mitigation Decision.

HAWK can kill rats and mice in a single feeding with its powerful anticoagulant bromadiolone. Use HAWK with confidence for unsurpassed control, even against warfarin resistant “super-rats.” Rats and mice die in 4 or 5 days after eating just a single-feeding of HAWK. A superior formulation makes HAWK irresistible to rats and mice.

ERAZE AG
Motomco-Kills rats & mice. Teaspoon amounts control in a single-feeding. 2% Zinc Phosphide. Scoop included.

(1) Kid & dog tested-Can use indoors and outdoors.
(3) Kid tested-Not dog tested-No outdoor use.

31318 NEW 31318 Soft Bait Pl-16lb (484-15gm pkts) 1

JAGUAR SOFT BAIT made with Brodifacoum. Extruded hole in center of bait for ease of placement. Does not freeze. Won’t melt even at temps above 200°. Larger, 15g bait sachet requires fewer placements. Palatable formula.

RAMPAGE is a key component in the fight against resistance, as it contains Bromethalin 0.01%, a non-anticoagulant. RAMPAGE provides sure, fast control, in one to two days, or even hours in some instances. Rodents also stop feeding after eating a lethal dose of RAMPAGE, so more rodents are controlled with less bait. There is no secondary poisoning with RAMPAGE; pets won’t be harmed if they accidentally eat a poisoned rodent.

Rats and mice are known to carry and transmit over 35 diseases that are threats to humans and domestic livestock.

**Rat Bait:** Cheese, chicken or fowl flesh, cereal grains, peanut butter and oatmeal mixed, peppermint candy.

**Skunk Bait:** Chicken entrails, crackels, fish-canned or fresh-insect larvae such as May beetles, crisp bacon or cat food.

**Squirrel Bait:** Cereal, grains, nuts (especially peanuts) sunflower seeds, anise oil (a drop or two on bread), shelled corn, apples. Mixed peanut butter and oatmeal or peanut butter and molasses, popcorn. One trapper sweats by almond extract on bread to tempt the nearest squirrel.

**Rabbit Bait:** Fresh vegetables (brussel sprouts, cabbage, carrots, lettuce), apples. In the wintertime, bread is a good bait, red fox urine. Spraying the inside of the trap with apple cider is also effective.

**BAIT STATIONS**

**TOMCAT Versatile Rodent Bait Station**
Can be positioned vertically or horizontally to fit any baiting or trapping situation. Removable tray makes it easy to clean. Can be easily fastened to walls. Can hold bait chunx or mouse traps.

GOPHER BAIT

GOPHER BAIT 50
Strychnine Treated Grain Bait

Product Features:
Strychnine treated grain bait for pocket gopher control. Subsoil applications only. Insert one tablespoon of bait into the gopher burrow system. One pound of bait will treat one to eight acres.

Key Insects:
pocket gophers

Use Sites:
rangelands, pastures, croplands, fields

Active Ingredients:
Strychnine 0.5%

Brand:
Martins®

www.martinsbrand.com

Muslim often harbor the plains pocket gopher (Geomys bursarius). Gophers eat mostly plant roots but also some above-ground parts, including alfalfa crown buds. They often build their burrows in the most productive field areas that have the most available food supplies. They destroy vegetation directly over their burrows, creating thin plant stands or bare spots. Gopher activity does have some benefits. It increases water infiltration and reduces soil compaction. For forage production, however, the damage can easily outweigh the benefits. In some studies, gophers reduced alfalfa yields by up to 46 percent. The mounds also can damage mowing and bailing equipment. Holes or burrows near the surface can injure grazing animals. Gopher control requires a long-term commitment and attention to timing. Poisoning and trapping are the most common ways to control gophers. Trapping takes time and works well in small areas (and larger ones, if a cheap labor source exists). Poisoning works well over large areas. This should be done in early spring or late fall when gophers are actively seeking and storing food. Baits should be placed in burrows, not left on the soil surface.

Gopher Killer

Motomco—Controls pocket gophers. Kills gophers in hours. Easy to apply. Ready to use pelleted bait. Specially sized pellets to fit most bait spreaders. 2% Zinc Phosphide. Scoop included.

#32553 - 1lb jar  #32541 - 5lb pail

RODENT SMOKE BOMBS

Rapid gas killer for tunneling and burrowing rodents. Gas cartridge kills rats, gophers, ground hogs, skunks, squirrels and moles. Fills hole with poisonous gas. Cartridge can be instantly extinguished with water.

6 Keys to Successfully Control Rats & Mice

Choosing the right product for the job.

- Your choice of rodent control product depends upon several factors:
  - The type of problem you’re experiencing – mouse or rat problems.
  - The severity of the problem – a bad infestation, minor problem, occasional intruder.
  - Environmental conditions – indoors or outdoors, the presence of children and pets, sanitation conditions, single dwelling or apartment complex.
  - Control preferences – how comfortable you are using a particular method of control.

Placing product where rodents travel.

- An inspection of the premises will reveal the problem areas and the species involved - mice or rats. Place bait or traps where rats or mice will find it, usually along their runways next to walls or where you’ve seen droppings, nesting materials, gnaw marks, burrows or other signs of rodents.
- The idea is to place the trap or bait in the area where it will intercept the rodent while it is traveling from it’s nest to a food source.
  - For mice - this is typically 10-30 feet.
  - For rats - this is typically 25-100 feet.

Use enough product placements.

- A common mistake in controlling rodents is underestimating their numbers.
  - For mice - space placements at 8-12 foot intervals.
  - For rats - space placements at 15-30 foot intervals.
- Note: Make sure to keep a fresh supply of bait and remove any spoiled bait. Move devices if you are not achieving results.

Read the label before using.

- With bait, the label is the law. Before using any product, read the instructions carefully. The label instructions give useful information on bait or trap placement.

Always secure bait in bait stations.

- To reduce the chances that children, pets, and other wildlife will come into contact with the bait always secure the bait inside of a bait station.
- Bait stations are available in different sizes to accommodate rats and mice. Additionally, rodents feel secure in these bait stations where they find and eat the bait. Bait stations should be placed in areas where signs of rodent activity are visible to achieve the best results.
- Motomco offers stations that have been tested and proven tamper-resistant to kids and kids & dogs in both disposable and refillable options. However, it is still safest to always place all rodent control products in areas inaccessible to children and pets.

Eliminate rodents’ food, water, and harbourage whenever possible.

- Reduce the chances of having a severe or persistent rodent problem by applying rodent-proofing measures, such as plugging holes where rodents are entering buildings. Get rid of the rodents’ food and water, whenever possible. Store food in containers. Clean up the problem area by getting rid of clutter. Disrupting the rodents’ environment stresses them and may send them scurrying.
